

CHILD-FRIENDLY TESTING AT CHILDREN'S HOSPITAL BOSTON

Doctors and testing professionals agree: the less stressful the surroundings, the more accurate the test results are likely to be. IAC AccuTone™2 Audiology Series testing rooms are designed to embrace this concept both inside and out.

At Children's Hospital Boston, which is part of Harvard University, the design firm took the stress reduction one step further. Rather than have children face a huge, intimidating structure, the hospital commissioned muralist Joanne Coughlin to re-create child-friendly scenes of Boston. Instead of walking through a formidable door to the scary and unknown, the children literally enter into a familiar scene.

In addition to reducing the scale of the testing room, the mural gives parents and medical staff additional opportunities to help reduce a child's apprehension before the testing. Parents can distract the child through a discover session. Similarly, doctors can use the mural to bond with the child.

The newly developed IAC AccuTone™2 Concept offers unlimited aesthetic possibilities that include color, texture, greater visibility and an open spacious feel. As always, the modular rooms are laboratory developed, field proven, are UL listed and carry the UL label for safety. Now standard on the AccuTone™2 is the exterior stucco finish. And, any booth may be ordered with optional finishes such as wood or brushed metal. One recent installation was custom-covered in fabric to match the existing decor.

The IAC AccuTone™2 Audiology Series is available in 86 standard sizes, but hundreds of interchangeable configurations are possible. Rooms can be disassembled, reconfigured or reassembled in a new location without loss of performance or function.

VA MEDICAL CENTER ANN ARBOR, MICHIGAN

Navigating around a hospital can be confusing even in the best of circumstances. That's why color was so important a component when the Veterans Affairs Medical Center in Ann Arbor Michigan ordered four IAC AccuTone™2 140-ACT suites. The room, the room's door and the floor tiles immediately leading to it are all color coded, making navigation simple and easy.

IAC provided turn-key services for the facility including design, manufacture, delivery and complete installation; with the help of facilities Director Aaron Schrier, VA Michigan.

The four custom suites were "super-sized" and is now one of the largest ever provided by IAC for audiometric testing applications. The rooms featured baseboard electrical system, oversized exterior IAC Noise-Lock® doors, crash rails, hand rails, drop ceilings, and are constructed with IAC Noise-Lock® V panel system. The double-wall exam rooms are provided with Level 1 EMI shielding effectiveness.

The facility featured the latest computer based audiometric test equipment, wired complete by IAC through a central data control center. Low voltage and communication systems were also supplied and installed complete.

The newly developed IAC AccuTone™2 Concept offers unlimited aesthetic possibilities that include color, texture, greater visibility and an open spacious feel. As always, the modular rooms are laboratory developed, field proven, are UL listed and carry the UL label for safety.

DWIGHT D. EISENHOWER ELEMENTARY SCHOOL PALM BEACH, FLORIDA

IAC America recently completed installation of an AccuTone®2 Audiology Series 140 ACT double-wall Examination Room, single-wall Control Room Suite at the Dwight D. Eisenhower Elementary School in Palm Beach County Florida.

The AccuTone®2 Audiology Series suite was sized to maximize the allowable space allocated at the school. Included was a full vision glass in the door leaf as well as an oversized viewing window between the patient and the Audiologist. The window also helps prevent feelings of claustrophobia on patients' part when situated for varying time periods in the confined environment of the sound room. The sound booth was fitted with an enhanced jack panel with connectors to support the latest audiometric equipment. Each booth was fitted to accommodate data ports and fire/strobe light systems.

Also furnished were roof-top silencers that were integrated with the building's HVAC to provide a comfortable environment for conducting hearing and screening evaluations, with each room having its own thermostat. The booth was depressed inside a concrete slab so that the raised floor was aligned with the building walkway (see photo upper left center), thus eliminating the need for a handicap ramp.

The IAC AccuTone™2 Audiology Series is available in 86 standard sizes, but hundreds of interchangeable configurations are possible. Rooms can be disassembled, reconfigured or reassembled in a new location without loss of performance or function.
